

Windows Hello for Business: configure, then prove it

A policy on the device only means Hello is allowed. It's ready when the signed-in user has a Hello key, on the device and in Entra ID.

Configure → Provision → Verify device → Verify fleet

1 Configure the policy

- ✓ Use the Intune tenant-wide setting (Devices > Windows > Windows Enrollment > Windows Hello for Business) or a Settings catalog policy
- ✓ Core settings: **Use Windows Hello for Business** and **Require Security Device** (TPM)
- ✓ Assign to a group of devices or users
- ✓ Delivered to the device through the PassportForWork CSP

The tenant-wide policy applies only at enrollment; later changes do not update enrolled devices. For overlapping settings, GPO takes precedence over PassportForWork CSP.

2 Meet prerequisites, let the user provision

- ✓ Device is Microsoft Entra joined or hybrid joined
- ✓ User signs in with their Entra account; provisioning starts after the profile loads, before the desktop
- ✓ User completes MFA and sets a PIN (and biometrics, if hardware supports it)
- ✓ Hybrid: pick a trust model, such as cloud Kerberos trust, for on-premises SSO

Provisioning is per user. Every prerequisite check must pass, or the user is never prompted.

3 Verify on the device

- ✓ Run `dsregcmd /status` as the user: NgcSet: YES plus an NgcKeyId confirm a key exists
- ✓ No key? Read prerequisite results in Applications and Services Logs > Microsoft > Windows > User Device Registration > Admin
- ✓ PassportForWork registry keys confirm the policy arrived — not that the user enrolled

Run `dsregcmd` in the user's own session. From an elevated or SYSTEM prompt, the User State section isn't valid.

4 Verify across the fleet

- ✓ Graph lists each user's Hello keys, with device name, key strength and dates
- ✓ Entra authentication methods reporting shows who has registered Hello — no script needed
- ✓ Intune policy status confirms delivery and flags conflicts or errors

Hello keys are user-specific and device-bound. Query users in Graph, then match the key to its device name.

Verification methods

What each one proves

`dsregcmd /status`

This user has a key on this device (NgcSet).

User Device Registration log

Why provisioning did or didn't start.

`GET /users/{id}/authentication/windowsHelloForBusinessMethods`

Registered keys per user, tenant-wide.
Least-privileged application permission: UserAuthMethod-WindowsHello.Read.All

Entra registration report

Who has registered Hello, in the portal.

✓ **Policy delivered isn't Hello ready.** Confirm a key exists for the user: on the device with `dsregcmd`, and in Entra ID through Graph or the registration report.
