

Intune is getting faster. Here's what's confirmed.

Push and event-driven checks are replacing timers, and the timers become the safety net. Some changes are documented by Microsoft; others come from MVP lab testing and can still change.

MICROSOFT LEARN Documented by Microsoft

MVP OBSERVED Seen in client logs, not documented

LEARN SAYS OTHERWISE Don't promise it yet

01 Policy delivery

MVP OBSERVED

BEFORE First change pushed fast; back-to-back changes could sit behind WNS throttling.

NOW "Fast lane": a per-device timer gives each batch of changes its own delivery slot.

If devices can't reach WNS, there's no fast lane — they fall back to the 8-hour cycle.

02 Remote actions

MVP OBSERVED

BEFORE Instant on day one, then a ~5-minute queued delay after the first 8 hours.

NOW Admin-triggered actions such as wipe keep an immediate lane, separate from policy drift.

Behavior traced in client logs; Microsoft hasn't published timings.

03 Device sync

MICROSOFT LEARN

BEFORE Sync woke Windows MDM; apps and scripts waited on the IME's own schedule.

NOW One Sync covers policies, apps and scripts — WNS for MDM, IC3 for the IME.

Service release 2607. The IC3 transport detail is from MVP testing.

04 Sync status

MICROSOFT LEARN

BEFORE Sync was fire-and-forget; no way to see where it stood.

NOW The Device sync status pane shows live progress, from notifying the device to compliance.

Needs the new device page; not every tenant had it at rollout.

05 Win32 apps

MICROSOFT LEARN

BEFORE Required apps waited for the IME's app check timer (about 60 minutes).

NOW Admin and service-side Win32 changes send a push, so the check starts within minutes.

Service release 2609. The 60-minute timer figure is from MVP testing.

06 Apps after ESP

MICROSOFT LEARN

BEFORE Required apps not installed during ESP waited for the next IME poll.

NOW The IME checks app assignments as soon as ESP or Autopilot device preparation finishes.

Service release 2609. Covers both Autopilot flows, not only ESP.

07 Custom compliance

LEARN SAYS OTHERWISE

LEARN Discovery scripts run every 8 hours, or when the user selects Check compliance.

SEEN Recent IME builds appear to add an hourly cadence for the compliance script.

Plan on 8 hours until Microsoft documents the change.

08 Real-time compliance

MICROSOFT LEARN

BEFORE A fixed setting waited for the next scheduled evaluation.

NOW A change to a monitored setting makes Intune request a check-in.

Monitored: Firewall, Antivirus, BitLocker, Defender status, real-time protection, OS build, Secure Boot. Throttled; custom compliance not included.

09 App inventory

MVP OBSERVED

BEFORE New installs showed up on the regular ~4-hour collection cycle.

NOW An app change can trigger a small delta upload in about 5 minutes.

Cooldowns apply to repeated changes. Requires the app inventory (Properties catalog) policy.

Under the hood

And what your firewall needs

WNS

Wakes Windows MDM for policy and compliance. Allow *.notify.windows.com and *.wns.windows.com on 443.

IC3 + Trouter

Live channel into the IME for apps, scripts and Sync. Allow your region's Trouter endpoint on 443.

Client-side monitoring

The device watches security signals and app changes, then asks Intune to re-evaluate.

Timers remain

Schedules are now the fallback. Platform scripts still run on their timer or a manual Sync.
